

Field studies in botany Volume 1

This historic book may have numerous typos and missing text. Purchasers can download a free scanned copy of the original book (without typos) from the publisher. Not indexed. Not illustrated. 1906 Excerpt: ... species first begin to expand their buds, noting whether the buds of all individuals of the same species open together, whether vegetative and flower buds expand at the same time, and when the leaves are fully out. If the fruit develops and falls while the studies are being made, this should be examined and its adaption to secure dispersal from the parent tree described. Having identified and located the trees and shrubs, attention may be given to the herbs. Unless some plan for the study is adopted, the work may become diffuse and lose much of its value, so many interesting forms occur in the best type of wood-lot. If the members of the class are required to identify a certain number of species for themselves, time enough must be given for this work to give practice sufficient to insure thoroughness and facility. In connection with it the student should prepare a herbarium of the species found in the part of the wood-lot in which he is at work. Since finding the names of plants is a means to an end and not an end in itself, as each species is examined, the form of the various organs may be considered in relation to their functions; the apparent meaning, in the economy of the plants, of such peculiarities as are found in roots, stems, leaves and flowers, may be brought out by questions. For example, the peculiar and interesting enlargement of the under ground stems of several spring flowering perennial herbs affords excellent material for study of this sort in considerable variety. Other work is suggested in the following pages. A LOCAL STUDY OF THE VEGETATION OF A WOOD-LOT The wood-lot shown in its winter condition in figure I, is situated on section 13, Lodi township, Washtenaw

County, near the foot of a gentle southward slope of a broad shallow valley....
