In submitting this volume to the notice of those interested in the study of Ferns I consider it proper, though at the risk of being considered egotistical, to give a brief explanation of the circumstances that have led to its publication. My first introduction to Ferns was in acquiring the names of the common British species. In 1823 the collection in the Royal Botanic Garden, Kew, came under my care; it then consisted of about forty hardy species, British and Foreign, and about the same number of tender exotics, the latter dispersed in various hothouses. In 1825 I arranged the tender ones in a group at the end of one of the then lean-to houses, the space they occupied being 12 feet by 6 feet; these formed the nucleus of the present great collection.
