

Library of natural history Volume 11

This historic book may have numerous typos and missing text. Purchasers can usually download a free scanned copy of the original book (without typos) from the publisher. Not indexed. Not illustrated. 1901 edition. Excerpt: ...while both are somewhat limited in the number of their species. In the Lucanidce the antennae are ten jointed, with the first joint long and set at an angle with the rest of the antennae, of which from three to seven of the last joints are furnished with rigid tooth-like processes on one side. The outer lobe of the maxillae ends in a pencil of hairs, while the inner lobe has very often the form of a claw; the ligula is membranous or leathery in texture, and is attached to the inner face of the mentum; the elytra cover over the abdomen, which on the ventral side shows five or, in the male, six segments; and the tarsi are five jointed, with a long slender spur projecting between the claws of the terminal joint, and carrying at the end two long bristles. The male insects are remarkable for the massive development of their jaws, which in many cases are forked and branched. The common GREAT BLACK WATER BEETLE. (Natural size.) i. Larva. 2. Male. 3. Female with egg cocoon. stag beetle (*Lucanus cervus*), one of the largest of European beetles, may, in the case of full-sized males attain a length of over two inches, or, if the mandibles be included, more than three inches. It is most abundant in the neighborhood of oak woods, and in England is not uncommon in the southern counties, where the males may be often observed on the wing on fine summer evenings, flying with a loud hum. The Passalidce are a small family of about two hundred known species, which are almost entirely restricted to the warmer parts of the world, the greater proportion being found in America. In the form of the antennae and in some other respects they show an affinity with the Lucanidce, though easily distinguished by the

characteristic of the mouth parts. The ligula is horny,...
